

# Axial piston variable pump

## A10VO series 52 and 53

**RE 92703**

Edition: 12.2015

Replaces: 10.2014

A10VO 63DRS/53...

- ▶ Sizes 10 to 100
- ▶ Nominal pressure 250 bar
- ▶ Maximum pressure 315 bar
- ▶ Open circuit

### Features

- ▶ Variable pump with axial piston rotary group in swash-plate design for hydrostatic drives in open circuit.
- ▶ The flow is proportional to the drive speed and the displacement.
- ▶ The flow can be infinitely varied by adjusting the swash-plate angle.
- ▶ Stable bearing for long service life
- ▶ High permissible drive speed
- ▶ Favorable power-to-weight ratio – compact dimensions
- ▶ Low noise
- ▶ Excellent suction characteristics
- ▶ Electro-hydraulic pressure control
- ▶ Power control
- ▶ Electro-proportional swivel angle control
- ▶ Short response times

## Hydraulic fluids

The A10VO variable pump is designed for operation with HLP mineral oil according to DIN 51524.

Application instructions and requirements for hydraulic fluids should be taken from the following data sheets before the start of project planning:

- ▶ 90220: Hydraulic fluids based on mineral oils and related hydrocarbons
- ▶ 90221: Environmentally acceptable hydraulic fluids

### Notes on selection of hydraulic fluid

The hydraulic fluid should be selected such that the operating viscosity in the operating temperature range is within the optimum range ( $v_{opt}$  see selection diagram).

### Note

At no point of the component may the temperature be higher than 115 °C. The temperature difference specified in the table is to be taken into account when determining the viscosity in the bearing.

If the above conditions cannot be maintained due to extreme operating parameters, please contact the responsible member of staff at Bosch Rexroth.

### Viscosity and temperature of hydraulic fluids

	Viscosity	Temperature	Comment
Cold start	$v_{max} \leq 1600 \text{ mm}^2/\text{s}$	$\theta_{St} \geq -40 \text{ }^\circ\text{C}$	$t \leq 1 \text{ min}$ , without load ( $p \leq 30 \text{ bar}$ ), $n \leq 1000 \text{ rpm}$
	Permissible temperature difference	$\Delta T \leq 25 \text{ K}$	between axial piston unit and hydraulic fluid
Warm-up phase	$v < 1600 \text{ to } 400 \text{ mm}^2/\text{s}$	$\theta = -40 \text{ }^\circ\text{C to } -25 \text{ }^\circ\text{C}$	Note the detailed information on operation with low temperatures, see data sheet 90300-03-B.
Continuous operation	$v = 400 \text{ to } 10 \text{ mm}^2/\text{s}$	$\theta = -25 \text{ }^\circ\text{C to } +110 \text{ }^\circ\text{C}$	This corresponds, for example on the VG 46, to a temperature range of +5 °C to +85 °C (see selection diagram page 7)
			measured at port <b>L</b> Observe the permissible temperature range of the shaft seal ( $\Delta T = \text{approx. } 5 \text{ K}$ between the bearing/shaft seal and port <b>L</b> )
	$v_{opt} = 36 \text{ to } 16 \text{ mm}^2/\text{s}$		Range of optimum operating viscosity and efficiency
Short-term operation	$v_{min} \geq 7 \text{ mm}^2/\text{s}$		$t < 1 \text{ min}$ , $p < 0.3 \cdot p_{nom}$

### ▼ Selection diagram

### **Filtration of the hydraulic fluid**

Finer filtration improves the cleanliness level of the hydraulic fluid, which increases the service life of the axial piston unit. A cleanliness level of at least 20/18/15 is to be maintained according to ISO 4406.

At very high hydraulic fluid temperatures (90 °C to maximum 115 °C), cleanliness level 19/17/14 according to at least ISO 4406 is necessary.

Please contact us if the above classes cannot be observed.

## Operating pressure range

Pressure at working port B		Definition
Nominal pressure $p_{nom}$	250 bar absolute	The nominal pressure corresponds to the maximum design pressure.
Maximum pressure $p_{max}$	315 bar absolute	The maximum pressure corresponds the maximum working pressure within the single operating period. The sum of the single operating periods must not exceed the total operating period.
Single operating period	2.5 ms	
Total operating period	300 h	
Minimum pressure $p_{B abs}$ (high pressure side)	10 bar absolute	Minimum pressure on the high-pressure side (B) which is required in order to prevent damage to the axial piston unit.
Rate of pressure change $R_{A max}$	16000 bar/s	Maximum permissible rate of pressure rise and reduction during a pressure change over the entire pressure range.
Pressure at suction port S (inlet)		
Minimum pressure $p_{S min}$	Standard 0.8 bar absolute	Minimum pressure at suction port S (inlet) that is required in order to avoid damage to the axial piston unit. The minimum pressure depends on the speed and displacement of the axial piston unit.
Maximum pressure $p_{S max}$	5 bar absolute	
Case drain pressure at port L <sub>1</sub> , L <sub>2</sub>		
Maximum pressure $p_{L max}$	2 bar absolute	Maximum 0.5 bar higher than inlet pressure at port S, but not higher than $p_{L max}$ . A case drain line to the reservoir is required.

### ▼ Rate of pressure change $R_{A max}$

### ▼ Pressure definition

### ▼ Maximum permissible speed (limit speed)

Permissible speed by increasing inlet pressure  $p_{abs}$  at suction opening S or at  $V_g \leq V_{gmax}$

Total operating period =  $t_1 + t_2 + \dots + t_n$

### Note

Operating pressure range valid when using hydraulic fluids based on mineral oils. Please contact us for values for other hydraulic fluids.

Determining the operating characteristics			
Flow	$q_v$	$= \frac{V_g \times n \times \eta_v}{1000}$	[l/min]
Torque	$T$	$= \frac{V_g \times \Delta p}{20 \times \pi \times \eta_{hm}}$	[Nm]
Power	$P$	$= \frac{2 \pi \times T \times n}{60000} = \frac{q_v \times \Delta p}{600 \times \eta_t}$	[kW]

### Key

$V_g$	Displacement per revolution [cm <sup>3</sup> ]
$\Delta p$	Differential pressure [bar]
$n$	Rotational speed [rpm]
$\eta_v$	Volumetric efficiency
$\eta_{hm}$	Mechanical-hydraulic efficiency
$\eta_t$	Total efficiency ( $\eta_t = \eta_v \times \eta_{hm}$ )

### Note

- Theoretical values, without efficiency and tolerances; values rounded
- Operation above the maximum values or below the minimum values may result in a loss of function, a reduced service life or in the destruction of the axial piston unit. Bosch Rexroth recommends testing the load by means of experiment or calculation / simulation and comparison with the permissible values.

- 1) Only series 52
- 2) Only series 53
- 3) The values are applicable:
  - At absolute pressure  $p_{abs} = 1$  bar at suction port **S**
  - For the optimal viscosity range of  $\nu_{opt} = 36$  to  $16$  mm<sup>2</sup>/s
  - For hydraulic fluid based on mineral oils
- 4) Please contact us regarding higher speeds

- 5) The scope of application lies between the minimum necessary and the maximum permissible drive speeds. It applies for external stimuli (e. g. engine 2 to 8 times rotary frequency, Cardan shaft twice the rotary frequency). The limit value is only valid for a single pump. The load capacity of the connecting parts must be considered.

**Permissible radial and axial forces on the drive shaft**

Size	NG	10	18	28	45	60/63	72	85	100		
Maximum radial force at a/2		$F_{q \max}$	N	250	350	1200	1500	1700	1500	2000	2000
Maximum axial force		$\pm F_{ax \max}$	N	400	700	1000	1500	2000	1500	3000	3000

**Note**

- The values given are maximum values and do not apply to continuous operation. For drives with radial loading (pinion, V-belt drives), please contact us!

**Permissible input and through drive torques**

Size		10	18	28	45	60/63	72	85	100		
Torque at $V_{g \max}$ and $\Delta p = 250 \text{ bar}^1$	$T_{\max}$	Nm	42	71	111	179	250	321	338	398

	W	$T_{D \max}$	Nm	–	–	140	220	396	383	650	636

**▼ Distribution of torques**

Torque at 1st pump	$T_1$
Torque at 2nd pump	$T_2$
Torque at 3rd pump	$T_3$
Input torque	$T_E = T_1 + T_2 + T_3$
	$T_E < T_{E \max}$
Through-drive torque	$T_D = T_2 + T_3$
	$T_D < T_{D \max}$

1) Efficiency not considered

2) For drive shafts with no radial force

## DR – Pressure control

The pressure controller limits the maximum pressure at the pump outlet within the control range of the variable pump. The variable pump only supplies as much hydraulic fluid as is required by the consumers. If the operating pressure exceeds the pressure setting at the pressure valve, the pump will regulate to a smaller displacement to reduce the control differential.

- ▶ Basic position in depressurized state:  $V_{g \max}$ .
- ▶ Setting range<sup>1)</sup> for pressure control 35 to 250 bar. Standard is 250 bar.

### ▼ Characteristic curve DR

Characteristic curve valid for  $n_1 = 1500$  rpm and  $t_{\text{fluid}} = 50$  °C.

### ▼ Circuit diagram DR

### Controller data

Size		10	18	28	45	60	72	85	100	
						63				
Pressure increase	$\Delta p$ [bar]	6	6	6	6	8	8	12	14	
Hysteresis and repeatability	$\Delta p$ [bar]	maximum 3								
Control fluid consumption	l/min	maximum approx. 3								

<sup>1)</sup> In order to prevent damage to the pump and the system, the permissible setting range must not be exceeded. The range of possible settings at the valve is higher.

## DRG – Pressure control, remotely operated

For the remote-controlled pressure control, the LS pressure limitation is performed using a separately arranged pressure relief valve. Therefore any pressure control value under the pressure set on the pressure controller can be regulated. Pressure controller DR see page 12.

A pressure relief valve is externally piped to port **X** for remote setting of pressure below the setting of the DR control valve spool. This relief valve is not included in the scope of delivery of the DRG control.

When there is differential pressure  $\Delta p$  at the control valve and with the standard setting on the remote-controlled pressure cut-off of 20 bar, the amount of control fluid at the connection is **X** approx. 1.5 l/min. If a different setting (range 10 to 22 bar) is required, please state in plain text.

As a separate pressure relief valve **(1)** we recommend:

- ▶ a directly controlled, hydraulic or electric proportional one, suitable for the control fluid mentioned above.

The max. length of piping should not exceed 2 m.

- ▶ Basic position in depressurized state:  $V_{g \max}$ .
- ▶ Setting range<sup>1)</sup> for pressure control 35 to 250 bar **(3)**. Standard is 250 bar.
- ▶ Setting range for differential pressure 10 to 22 bar **(2)**. Standard is 20 bar.

Unloading port **X** to the reservoir results in a zero stroke (standby) pressure which is approx. 1 to 2 bar higher than the defined differential pressure  $\Delta p$ , however system influences are not taken into account.

### ▼ Characteristic curve DRG

Characteristic curve valid for  $n_1 = 1500$  rpm and  $t_{\text{fluid}} = 50$  °C.

### ▼ Circuit diagram DRG

- 1** The separate pressure relief valve and the line are not included in the scope of delivery.
- 2** Remote-controlled pressure cut-off **(G)**.
- 3** Pressure controller **(DR)**

### Controller data

Size	10	18	28	45	60 63	72	85	100
Pressure increase	$\Delta p$ [bar] 6	6	6	6	8	8	12	14
Hysteresis and repeatability	$\Delta p$ [bar] maximum 3							
Control fluid consumption	l/min maximum approx. 4.5							

1) In order to prevent damage to the pump and the system, the permissible setting range must not be exceeded. The range of possible settings at the valve is higher.

2) Zero stroke from pressure setting  $\Delta p$  on controller **(2)**

## DRF (DFR) / DRS (DFR1) / DRSC- Pressure and flow control

In addition to the pressure controller function (see page 12), a variable orifice (e.g. directional valve) is used to adjust the differential pressure upstream and downstream of the orifice. This is used to control the pump flow. The pump flow is equal to the actual hydraulic fluid quantity required by the consumer. With all controller combinations, the  $V_g$  reduction has priority.

- ▶ Basic position in depressurized state:  $V_{g \max}$ .
- ▶ Setting range<sup>1)</sup> to 250 bar.
- ▶ DR pressure controller data see page 12

### ▼ Characteristic curve DRF (DFR) / DRS (DFR1) / DRSC

### ▼ Characteristic curve at variable speed

Characteristic curves valid for  $n_1 = 1500$  rpm and  $t_{fluid} = 50$  °C.

- 1) In order to prevent damage to the pump and the system, the permissible setting range must not be exceeded. The range of possible settings at the valve is higher.
- 2) Zero stroke from differential pressure setting  $\Delta p$  on controller **(2)**

### ▼ Circuit diagram DRF (DFR)

- 1** The metering orifice (control block) and the line is not included in the delivery contents.
- 2** Pressure and flow controller (**FR**).
- 3** Pressure controller (**DR**)

#### Note

The DRS and (DFR1) and DRSC valve versions have no pilot line between **X** and the reservoir.

Unloading the LS-pilot line must be possible in the valve system.

Because of the flushing function sufficient unloading of the flow control in DRS (DFR1) control valve **X**-line must also be provided.

If this pilot line of the **X** line does not have to be guaranteed, the DRSC control valve must be used.

For further information see page 15

**Differential pressure  $\Delta p$ :**

- ▶ Standard setting: 14 bar  
 If another setting is required, please state in clear text.
- ▶ Adjustment range: 14 to 22 bar

Unloading port **X** to the reservoir results in a zero stroke (standby) pressure which is approx. 1 to 2 bar higher than the defined differential pressure  $\Delta p$ , however system influences are not taken into account.

**Controller data**

- ▶ DR pressure controller data see page 12.
- ▶ Maximum flow deviation measured at drive speed  
 n = 1500 rpm.

Size		10	18	28	45	60	72	85	100
						63			
Flow deviation	$\Delta q_{vmax}$ [l/min]	0.5	0.9	1.0	1.8	2.5	2.5	3.1	3.1
Hysteresis; repeatability	$\Delta p$ [bar]	maximum 3							
Control fluid consumption	l/min	maximum approx. 3 to 4.5 (DRF (DFR)) maximum approx. 3 (DRS (DFR1) / DRSC)							

## LA... – Pressure, flow and power controller

Pressure control equipped as DR(G), see page 12 (13).  
Equipment of the flow control like DRS (DFR1), see page 14.

In order to achieve a constant drive torque with varying operating pressures, the swivel angle and with it the volume flow from the axial piston pump is varied so that the product of flow and pressure remains constant. Flow controller is possible below the power control curve. When

ordering please state the power characteristics to be set ex works in clear text, e.g. 20 kW at 1500 rpm.

### Controller data

- ▶ Pressure controller DR see page 12.
- ▶ Pressure and flow controller DR see page 14.
- ▶ See data sheet 92709 for electric override LA.S
- ▶ Control fluid consumption max. approx. 5.5 l/min

Start of control	Torque T [Nm] for size							Order code
	18	28	45	63	72	85	100	
10 to 35 bar	3.8 – 12.1	6 – 19	10 – 30	15 – 43	17 – 49.2	20 – 57	24 – 68	LA5

**1** The pressure relief valve and the line are not included in the scope of delivery.

## ED – Electro-hydraulic pressure control

The ED valve is set to a certain pressure by a specified variable solenoid current.

When changing the consumer (load pressure), this causes an increase or decrease in the pump swivel angle (flow) in order to maintain the electrically set pressure level.

The pump thus only delivers as much hydraulic fluid as the consumers can take. The desired pressure level can be set steplessly by varying the solenoid current.

As the solenoid current signal drops towards zero, the pressure will be limited to  $p_{max}$  by an adjustable hydraulic pressure cut-off (secure fail safe function in case of a loss of power, e.g. for fan drives). The response time characteristic curve of the ED-control was optimized for the use as a fan drive system. When ordering, specify the type of application in clear text.

### ▼ Static current-pressure characteristic curve ED (negative characteristic curve measured with pump in zero stroke)

► Hysteresis static < 3 bar.

### ▼ Flow-pressure characteristic curve

- Characteristic curves valid for  $n_1 = 1500$  rpm and  $t_{fluid} = 50$  °C.
- Control fluid consumption: 3 to 4.5 l/min.
- For standby standard setting, see the following diagram, other values on request.

### ▼ Influence of the pressure setting on standby (maximally energized)

### ▼ Circuit diagram ED71/ED72

Technical data, solenoid	ED71	ED72
Voltage	12 V (±20%)	24 V (±20%)
Control current		
Start of control at $p_{max}$	100 mA	50 mA
End of control at $p_{min}$	1200 mA	600 mA
Limiting current	1.54 A	0.77 A
Nominal resistance (at 20 °C)	5.5 Ω	22.7 Ω
Dither frequency	100 to 200 Hz	100 to 200 Hz
Duty cycle	100%	100%
Type of protection: see connector version page 61		
Operating temperature range at valve	-20 °C to +115 °C	

## ER – Electro-hydraulic pressure control

The ER valve is set to a certain pressure by a specified variable solenoid current.

When changing the consumer (load pressure), this causes an increase or decrease in the pump swivel angle (flow) in order to maintain the electrically set pressure level.

The pump thus only delivers as much hydraulic fluid as the consumers can take. The desired pressure level can be set steplessly by varying the solenoid current.

As the solenoid current signal drops towards zero, the pressure will be limited to  $p_{min}$  (stand by).

**Observe project planning notes.**

### ▼ Static current-pressure characteristic curve ER (positive characteristic curve measured with pump in zero stroke)

► Hysteresis static current-pressure characteristic curve < 3 bar.

### ▼ Flow-pressure characteristic curve

- Characteristic curves valid for  $n_1 = 1500$  rpm and  $t_{fluid} = 50$  °C.
- Control fluid consumption: 3 to 4.5 l/min.
- Standby standard 14 bar. Other values on request.
- Influence of pressure setting on stand-by  $\pm 2$  bar.

### ▼ Circuit diagram ER71/ER72

Technical data, solenoid	ER71	ER72
Voltage	12 V ( $\pm 20\%$ )	24 V ( $\pm 20\%$ )
Control current		
Start of control at $p_{min}$	100 mA	50 mA
End of control at $p_{max}$	1200 mA	600 mA
Limiting current	1.54 A	0.77 A
Nominal resistance (at 20 °C)	5.5 $\Omega$	22.7 $\Omega$
Dither frequency	100 to 200 Hz	100 to 200 Hz
Duty cycle	100%	100%
Type of protection: see connector version page 61		
Operating temperature range at valve	-20 °C to +115 °C	

### Project planning note!

Excessive current levels ( $I > 1200$  mA at 12 V or  $I > 600$  mA at 24 V) to the ER solenoid can result in undesired pressure increases which can lead to pump or system damage. Therefore:

- Use  $I_{max}$  current limiter solenoids.
- A sandwich plate pressure reducing valve can be used to protect the pump in the event of overflow. An accessory kit with intermediate plate pressure controller can be ordered from Bosch Rexroth under part number R902490825.

## EP – Electro-proportional control

Electro-proportional control makes a stepless and reproducible setting of the pump displacement possible directly via the swashplate. The control force of the control piston is applied by a proportional solenoid. The control is proportional to the current (for start of control, see table right). In a depressurized state, the pump is swiveled to its initial position ( $V_{g \max}$ ) by an adjusting spring. If the operating pressure exceeds a limit value of approx. 4 bar, the pump starts to swivel from  $V_{g \max}$  to  $V_{g \min}$  without control by the solenoid (control current < start of control). With a minimum swivel angle  $V_{g \min}$  and de-energized EP solenoids, a minimum pressure of 10 bar must be maintained, or alternatively a minimum amount of 5 % of the displacement. A PWM signal is used to control the solenoid.

**EP.D:** The pressure control regulates the pump displacement back to  $V_{g \min}$  after the set target pressure has been reached. A minimum operating pressure of 14 bar is needed for safe and reproducible control. The necessary control fluid is taken from the high pressure.

### ▼ Characteristic curve EP1/2

- Hysteresis static current-displacement characteristic curve < 5%.

### ▼ Circuit diagram EP.D

Technical data, solenoid	EP1	EP2
Voltage	12 V ( $\pm 20\%$ )	24 V ( $\pm 20\%$ )
Control current		
Start of control at $V_{g \min}$	400 mA	200 mA
End of control at $V_{g \max}$	1200 mA	600 mA
Minimum working stroke of the dither within the control range <sup>1)</sup>	352 mA	176 mA
Dither frequency	100 to 200 Hz	100 to 200 Hz
Limiting current	1.54 A	0.77 A
Nominal resistance (at 20 °C)	5.5 $\Omega$	22.7 $\Omega$
Duty cycle	100%	100%
Type of protection: see connector version page 61		
Operating temperature range at valve -20 °C to +115 °C		

### Note

We recommend the valve with flushing function for the EP.D control variant. Please contact us.

1)  $\Delta I$  = 44% of the current difference within the control range, regardless of the mean value of the current

## EK – Electro-proportional control with controller cut-off

Variants EK... is based completely on the variant EP... (see page 20).

In addition to the electro-proportional control function, a controller cut-off is integrated in the electric characteristic curve. The pump then swivels to  $V_{g \max}$  if the pilot signal is lost (e.g., cable break) and then works with the DRF settings if necessary (see page 12). The controller cut-off is only intended for short-term use and not for permanent use if the control signal is lost. If the control signal is lost, the pump swivel times are increased by the EK valve.

A PWM signal is used to control the solenoid.

### Note

A minimum operating pressure of 50 bar is needed for safe and reproducible electro-proportional control with controller cut-off. For lower pressures, a pilot signal of > 500 mA (EK2) or > 1000 mA (EK1) is required in order to avoid undesired controller cut-off. The necessary control fluid is taken from the high pressure.

In the  $V_{g \max}$  the spring force of the return spring is maximum. To overcome the force of this spring, the solenoid must be subjected to excessive current ( $I_{res}$ ).

### ▼ Characteristic EK1/2

- ▶ Hysteresis static current-displacement characteristic curve < 5%.
- ▶ For changes in current, ramp times of > 200 ms must be observed.

### ▼ Circuit diagram EK.D

Technical data, solenoid	EK1	EK2
Voltage	12 V (±20%)	24 V (±20%)
Control current		
Start of control at $V_{g \min}$	400 mA	200 mA
End of control at $V_{g \max}$	1200 mA	600 mA
Minimum working stroke of the dither within the control range <sup>1)</sup>	352 mA	176 mA
Dither frequency	100 to 200 Hz	100 to 200 Hz
Limiting current	1.54 A	0.77 A
Nominal resistance (at 20 °C)	5.5 Ω	22.7 Ω
Duty cycle	100%	100%
Type of protection: see connector version page 61		
Operating temperature range at valve	-20 °C to +115 °C	

	EK1	EK2
$I_{\min}$ [mA]	400	200
$I_{\max}$ [mA]	1200	600
$I_{\text{off}}$ [mA]	< 300	< 150
$I_{\text{res}}$ [mA]	> 1200	> 600

### Note

We recommend the valve with flushing function for the EK.D control variant. Please contact us.

<sup>1)</sup>  $\Delta I = 44\%$  of the current difference within the control range, regardless of the mean value of the current

## EP(K).DF / EP(K).DS / EP(K) – with pressure and flow control

A hydraulic pressure flow control is superimposed on the electro-proportional control.

The pressure control regulates the pump displacement infinitely varied back to  $V_{g\ min}$  after the set target pressure has been reached.

This function is super-imposed on the EP or EK control, i.e. the control-current dependent EP or EK function is executed below the target pressure.

For the adjustment range of the pressure flow control, see page 12 to 15.

With all controller combinations, the  $V_g$  reduction has priority.

With flow control, the pump flow can be influenced in addition to pressure control. The pump flow is thus equal to the actual amount of hydraulic fluid required by the consumer. This is achieved using the differential pressure at the consumer (e.g. orifice).

The EP.DS or EK.DS version has no connection between X and the reservoir (load sensing). Please refer to the notes on page 14.

### ▼ Circuit diagram EP.D

1 The sensing orifice (control block) and the line is not included in the delivery contents.

### ▼ Circuit diagram EP.DF

### ▼ Circuit diagram EP.DS

## EP.ED / EK.ED – with electro-hydraulic pressure control

The ED valve is set to a certain pressure by a specified variable solenoid current.

When changing the consumer (load pressure), this causes an increase or decrease in the pump swivel angle (flow) in order to maintain the electrically set pressure level.

The pump thus only delivers as much hydraulic fluid as the consumers can take. The pressure can be set steplessly by the solenoid current.

As the solenoid current signal drops towards zero, the pressure will be limited to  $p_{max}$  by an adjustable hydraulic pressure cut-off (negative characteristic curve, e.g. for fan drives ). A PWM signal is used to control the solenoid.

For further information and technical data of the solenoids for ED(ER) control please refer to pages 18 to 21.

## Combination pumps A10VO + A10VO

By using combination pumps, it is possible to have independent circuits without the need for splitter gearboxes. When ordering combination pumps, the type designations of the 1st and 2nd pump must be linked by a "+".

**Order example:**

**A10VO85DRS/53R-VSC12K04+**

**A10VO45DRF/53R-VSC11N00**

It is permissible to use a combination of two single pumps of the same nominal size (tandem pump) considering a dynamic mass acceleration of maximum 10 g (= 98.1 m/s<sup>2</sup>) without additional support brackets.

For combination pumps consisting of more than two pumps, the mounting flange must be rated for the permissible mass torque (please consult us).

$m_1, m_2, m_3$	Weight of pump	[kg]
$l_1, l_2, l_3$	Distance, center of gravity	[mm]

$$T_m = (m_1 \times l_1 + m_2 \times l_2 + m_3 \times l_3) \times \frac{1}{102} \text{ [Nm]}$$

### Permissible mass moment of inertia

NG			10	18	28	45	60/63	72	85	100
static	$T_m$	Nm	-	-	890	900	1370	1370	3080	3080
dynamic at 10 g (98.1 m/s <sup>2</sup> )	$T_m$	Nm	-	-	89	90	137	137	308	308
Weight with through-drive plate	$m$	kg	-	13	18	24	28	28	45	45
Weight without through-drive plate (e.g. 2nd pump)			8	11.5	15	18	22	22	36	36
Distance, center of gravity <b>without</b> through drive	$l_1$	mm	-	78	85	96	105	105	122	122
Distance, center of gravity <b>with</b> through drive	$l_1$	mm	-	87	99	115	127	127	150	150

## Connector for solenoids

### DEUTSCH DT04-2P-EP04

Molded connector, 2-pin, without bidirectional suppressor diode

The following type of protection ensues with a mounted mating connector:

- ▶ IP67 (DIN/EN 60529) and
- ▶ IP69K (DIN 40050-9)

#### ▼ Circuit diagram symbol

#### ▼ Mating connector DEUTSCH DT06-2S-EP04

1 wedge	W2S
2 sockets	0462-201-16141

The mating connector is not included in the scope of delivery. This can be supplied by Bosch Rexroth on request (material number R902601804).

#### Changing plug position

If necessary, you can change the position of the connector by turning the solenoid.

To do this, proceed as follows:

- ▶ Loosen the mounting nut **(1)** of the solenoid. To do this, turn the mounting nut **(1)** one revolution counter-clockwise.
- ▶ Turn the solenoid body **(2)** to the desired orientation.
- ▶ Re-tighten the mounting nut.  
Tightening torque: 5+1 Nm.  
(WAF 26, 12-sided DIN 3124)

On delivery, the position of the connector may differ from that shown in the brochure or drawing.

## Electronic controls

Control	Electronics function	Electronics	Data sheet
Electric pressure control	Controlled power outlet	RA	analog 95230
		RC4-5/30	digital 95205

## Installation instructions

### General

The axial piston unit must be filled with hydraulic fluid and air bled during commissioning and operation. This must also be observed following a longer standstill as the axial piston unit may empty via the hydraulic lines.

Particularly with the "drive shaft up/down" installation position, filling and air bleeding must be carried out completely as there is, for example, a danger of dry running. The case drain fluid in the pump housing must be directed to the reservoir via the highest available drain port (**L**, **L<sub>1</sub><sup>2)</sup>**, **L<sub>2</sub><sup>3)</sup>**).

For combinations of multiple units, the case drain fluid must be drained off at each pump. If a shared reservoir line is used for several units, make sure that the case pressure in each pump is not exceeded. The shared drain line must be dimensioned to ensure that the maximum permissible case pressure of all connected units is not exceeded in any operational circumstances, particularly at cold start. If this is not possible, separate drain lines must be laid if necessary.

To achieve favorable noise values, decouple all connecting lines using elastic elements and avoid above-reservoir installation.

In all operating conditions, the suction line and drain line must flow into the reservoir below the minimum fluid level. The permissible suction height  $h_s$  results from the overall loss of pressure. However, it must not be higher than  $h_{s \max} = 800$  mm. The minimum suction pressure at port **S** must also not fall below 0.8 bar absolute during operation and during cold start.

When designing the reservoir, ensure adequate distance between the suction line and the case drain line. This prevents the heated, return flow from being drawn directly back into the suction line.

### Note

In certain installation positions, an influence on the control characteristic can be expected. Gravity, dead weight and case pressure can cause minor shifts in control characteristic curves and changes in response time.

For key, see page 64.

1) Because complete air bleeding and filling are not possible in this position, the pump should be air bled and filled in a horizontal position before installation.

2) For NG10 and NG28 series 52, **L<sub>1</sub>** is opposite, L must then be connected if necessary.

3) Only series 53

### Installation position

See the following examples **1** to **12**.

Additional installation positions are possible upon request.  
Recommended installation position: **1** and **3**

### Below-reservoir installation (standard)

Below-reservoir installation is when the axial piston unit is installed outside of the reservoir and below the minimum fluid level.

Installation position	Air bleeding	Filling
<p><b>1</b><sup>2)</sup></p> 	<b>F</b>	<b>S + L or L<sub>1</sub></b>
<p><b>2</b><sup>1)</sup></p> 	<b>F</b>	<b>S + L<sub>1</sub></b>
<p><b>3</b><sup>3)</sup></p> 	<b>F</b>	<b>S + L or L<sub>1</sub></b>
<p><b>4</b></p> 	<b>F</b>	<b>S + L or L<sub>1</sub></b>

**Above-reservoir installation**

Above-reservoir installation means that the axial piston unit is installed above the minimum fluid level of the reservoir.

To prevent the axial piston unit from draining, a height difference  $h_{ES\ min}$  of at least 25 mm is required in position 6. Observe the maximum permissible suction height

$h_{S\ max} = 800\ mm$ .

A check valve in the case drain line is only permissible in individual cases. Consult us for approval.

For key, see page 64.

Installation position	Air bleeding	Filling
<p>5<sup>2)</sup></p>	F	L <sub>1</sub> or L
<p>6<sup>1)2)</sup></p>	F	L <sub>1</sub>
<p>7<sup>3)</sup></p>	F	L <sub>2</sub>
<p>8<sup>1)</sup></p>	F	S or L

- 1) Because complete air bleeding and filling are not possible in this position, the pump should be air bled and filled in a horizontal position before installation.
- 2) For NG10 and NG28 series 52, L<sub>1</sub> is opposite, L must then be connected if necessary.
- 3) Only series 53

### Reservoir installation

Inside-reservoir installation is when the axial piston unit is installed in the reservoir below the minimum fluid level. The axial piston unit is completely below the hydraulic fluid. If the minimum fluid level is equal to or below the upper edge of the pump, see chapter "Above-reservoir installation". Axial piston units with electric components (e.g. electric controls, sensors) must not be installed in a reservoir below the fluid level.

Installation position	Air bleeding	Filling
<p><b>9<sup>2)</sup></b></p> 	Via the highest available port <b>L</b>	Automatically via the open port <b>L</b> or <b>L<sub>1</sub></b> due to the position under the hydraulic fluid level
<p><b>10</b></p> 	Via the highest available port <b>L<sub>1</sub></b>	Automatically via the open port <b>L</b> , <b>L<sub>1</sub></b> or <b>S</b> due to the position under the hydraulic fluid level
<p><b>11<sup>3)</sup></b></p> 		
<p><b>12</b></p> 	Via the highest available port <b>L</b>	Automatically via the open port <b>L</b> , <b>L<sub>1</sub></b> or <b>S</b> due to the position under the hydraulic fluid level

### Key and assembly note

Key	
<b>F</b>	Filling / air bleeding
<b>S</b>	Suction port
<b>L; L<sub>1</sub></b>	Drain port
<b>SB</b>	Baffle (baffle plate)
$h_{t, \min}$	Minimum required immersion depth (200 mm)
$h_{\min}$	Minimum required distance to reservoir bottom (100 mm)
$h_{ES, \min}$	Minimum necessary height required to protect the axial piston unit from draining (25 mm)
$h_{S, \max}$	Maximum permissible suction height (800 mm)

### Note

Port **F** is part of the external piping and must be provided on the customer side to make filling and air bleeding easier.

- 1) Because complete air bleeding and filling are not possible in this position, the pump should be air bled and filled in a horizontal position before installation.
- 2) For NG10 and NG28 series 52, **L<sub>1</sub>** is opposite, **L** must then be connected if necessary.
- 3) Only series 53

## Project planning notes

- ▶ The A10VO axial piston variable pump is designed to be used in open circuit.
- ▶ The project planning, installation and commissioning of the axial piston unit requires the involvement of qualified personnel.
- ▶ Before using the axial piston unit, please read the corresponding instruction manual completely and thoroughly. If necessary, request it from Bosch Rexroth.
- ▶ Before finalizing your design, please request a binding installation drawing.
- ▶ The specified data and notes must be observed.
- ▶ Depending on the operating conditions of the axial piston unit (operating pressure, fluid temperature), the characteristic may shift.
- ▶ Preservation: Our axial piston units are supplied as standard with protection to preserve for a maximum of 12 months. If longer preservative protection is required (maximum 24 months), please specify this in plain text when placing your order. The preservation periods apply under optimal storage conditions, details of which can be found in the data sheet 90312 or the instruction manual.
- ▶ Not all variants of the product are approved for use in safety functions according to ISO 13849. Please consult the responsible contact person at Bosch Rexroth if you require reliability parameters (e.g.  $MTTF_d$ ) for functional safety.
- ▶ Depending on the type of control used, electromagnetic effects can be produced when using solenoids. When a direct current is applied, solenoids do not cause electromagnetic interference nor is their operation impaired by electromagnetic interference.  
 Other behavior can result when a modulated direct current (e.g. PWM signal) is applied. Potential electromagnetic interference for persons (e.g. persons with a pacemaker) and other components must be tested by the machine manufacturer.
- ▶ Pressure controllers are not safeguards against pressure overload. Be sure to add a pressure relief valve to the hydraulic system.
- ▶ Working ports:
  - The ports and fastening threads are designed for the specified maximum pressure. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the intended operating conditions (pressure, flow, hydraulic fluid, temperature) with allowance for the necessary safety margins.
  - The working ports and function ports can only be used to accommodate hydraulic lines.

## Safety instructions

- ▶ During and shortly after operation, there is a risk of burns on the axial piston unit and especially on the solenoids. Take appropriate safety measures (e.g. by wearing protective clothing).
- ▶ Moving parts in control equipment (e.g. valve spools) can, under certain circumstances, get blocked in position as a result of contamination (e.g. impure hydraulic fluid, abrasion, or residual dirt from components). As a result, the flow of hydraulic fluid and the build-up of torque in the axial piston unit can no longer respond correctly to the operator's specifications. Even the use of various filter elements (external or internal flow filter) will not rule out a fault but merely reduce the risk. The machine/system manufacturer must test whether remedial measures are needed on the machine for the application concerned in order to set the consumer being driven to a safe position (e.g. safe stop) and if necessary to ensure it is properly implemented.
